(MPLS)? MPLS is a packet-forwarding technology which uses labels in order to make data forwarding decisions. With MPLS, the Layer 3 header analysis is done just once (when the packet enters the MPLS domain). Label inspection drives subsequent packet forwarding. MPLS provides these beneficial applications:

MPLS FAQ For Beginners - Cisco

MPLS is best summarized as a “Layer 2.5 networking protocol”. In the traditional OSI model: Layer 2 covers protocols like Ethernet and SONET, which can carry IP packets, but only over simple LANs or point-to-point WANs. Layer 3 covers Internet-wide addressing and routing using IP protocols.

called Label Switch
Routers (LSR).

Generally, the network consists of a core LSR with an edge LSR that applies labels to packets. This is the setup mechanism of an MPLS network: Routing tables of the different LSRs are computed with an Interior Gateway Protocol (IGP).

Multiprotocol ...

An MPLS Virtual Private Network (VPN) consists of a set of sites that are interconnected by means of a Multiprotocol Label Switching (MPLS) provider core network. At each customer site, one or more customer edge (CE) devices attach to one or more provider edge (PE) devices. This module explains how to create an MPLS VPN.
