NumPy's main object is the homogeneous multidimensional array. It is a table of elements (usually numbers), all of the same type, indexed by a tuple of positive integers. In NumPy dimensions are called axes. For example, the coordinates of a point in 3D space [1, 2, 1] has one axis.

Quite simply, Numpy is a scientific computing library for Python that provides the functionality of matrix operations, which are generally used with Scipy and Matplotlib. In fact, the list already provides a matrix-like representation, but it provides us with more functions. If you have using Matlab, Scilab, then this tool is very good for you.

NumPy axes are the directions along the rows and columns. Just like coordinate systems, NumPy arrays also have axes. In a 2-dimensional NumPy array, the axes are the directions along the rows and columns. Axis 0 is the direction along the rows. In a NumPy array, axis 0 is the "first" axis.

Always use numpy arrays, and not numpy matrices. See what the numpy docs say about this. Also note that from python 3.5+, you can use @ for matrix multiplication with numpy arrays, which means there should be absolutely no good reason to use matrices over arrays. - Praveen Oct 14 '16 at 5:03
