In Part III we address the statistical analysis and computation of a variety of advanced models, such as generalized linear models, autoregressive and moving average models, Gaussian models, and state space models. Particular attention is paid to fast numerical techniques for classical and Bayesian inference on these models.

Statistical modeling is the process of applying statistical analysis to a dataset. A statistical model is a mathematical representation (or mathematical model) of observed data. When data analysts apply various statistical models to the data they are investigating, they are able to understand and interpret the information more strategically.

PNNL has one of the largest and most accomplished teams of statisticians and computational scientists in the Department of Energy's national laboratory complex. As leaders in mathematics research, mathematicians at PNNL develop novel computational modeling and data-analysis tools to predict and control complex systems and extract hidden features, anomalies, and signatures that support discovery and optimize data-gathering approaches through sampling and experimental design.

A statistical model is a mathematical model that embodies a set of statistical assumptions concerning the generation of sample data (and similar data from a larger population). A statistical model represents, often in considerably idealized form, the data-generating process. A statistical model is usually specified as a mathematical relationship between one or more random variables and other non-random variables. As such, a statistical model is "a formal representation of a theory" (Herman Adèr

The definition of differential entropy isn't invariant to changes in parameterization. Jaynes wanted to measure entropy relative to a base measure defined in terms of a "limiting density of discrete points" and I feel certain that other folk have come up with equivalent notions; such a thing would be required in e.g., Wallace's (fully Bayesian) Minimum Message Length paradigm.
