Raman spectroscopy has been applied in structural analysis of plant, animal and microbial glucans-starch, glycogen, cellulose, dextran, etc(96-100). The substitution at C-4 position of α -D-glucans leads to the appearance of an intense Raman band at 470-485 cm⁻¹ (amylose, amylopectin) instead of that at 540-545 cm⁻¹ (dextran) (100).

Structural analysis is a powerful tool for early determination of detectability/isolability possibilities. This is important both to evaluate if the number and placement of sensors is adequate in order to meet diagnosis specifications. Even though the structural information is very coarse, useful insights can be gained by analyzing the structure.
